

SHOT BLASTING & SPRAY PAINTING

FROM STRENGTH TO STRENGTH

Shot Blasting & Spray Painting

CFS Shot Blasting & Spray Painting

Shot blasting is a process in which steel shots are forced through a jet nozzle using compressed air pressure. This creates a fast and effective way of cleaning or preparing surfaces for recoating.

Shot blasting is the quickest way to remove rust, scale, old paint and other surface contamination from steel work. Our controlled blasting media mix ensures best cleaning of your components. The surface it provides gives a perfect bond for paint.

At our custom designed facility in Summerhill, Co. Meath we can facilitate large scale plant and equipment which we shot blast manually, as well as structural steelwork, racking and shelving for which we use a specifically designed shot blasting booth.

In addition, we provide a full priming and spray painting service to ensure that your plant, vehicle or equipment is delivered to you in pristine 'as new' condition.

Benefits

It will...

- Remove rust, paint, grease, scales from metal components,
- Improves aesthetics of the component by imparting matt finish,
- Improves quality of electroplating, painting, powder coating, or rubber lining,
- Renews old plant and machinery as new!

Applications of Shot Blasting

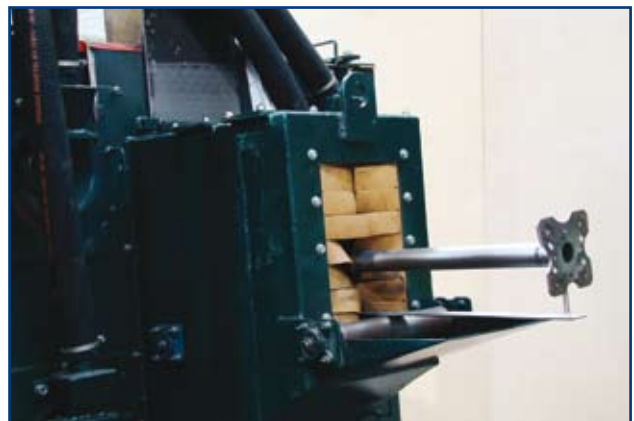

- Construction Equipment
- Structural Steelwork
- Machinery
- Automotive
- Process Equipment
- Racking and Shelving
- Waste Skips

BEFORE

AFTER

Conveyor shot blasting for construction equipment such as tubular steel, scaffolding and access systems.
